

Introduction to Java

Java Basics

- Java is an object-oriented programming language.
- All code has to belong to a class
- Entrypoint is usually the **main** method in **Main** class

(Naming) conventions

- class names start with upper case letters
- method and variable names start with lower case letters
- use camelCase rather than snake_case
- each class is in its own file
- filename is Classname.java
- There are no header files like e.g. in C++

Fun Facts

- Java was developed by Sun Microsystems in 1995
- It's creator was James Gosling (no known relation to Ryan)
- Alternavtive names under discussion were: Oak, Silk, DNA
- Java is related to Java Coffee, but it's not clear who came up with the name

Two columns to test CSS

- This is the first column
- and some more text
- Lorem ipsum dolor sit amet

- This is the second column
- it contains other text
- and one more line for lolz

Here is an image

to try out css management of images
